V6 Mac OSx Client

Please ensure you read through the following guide <u>before</u> deploying the V6 Mac OSx Client;

Pre Requisite Notes
Before installing the v6.2.3.29 MAC OSx client, JDK Java 1.8+ **<u>must be installed</u>** (not JRE).

The v6.2.3.29 client supports the following MAC OSx;

- Mountain Lion (Released July 25 2012)
- Mavericks (Released October 22, 2013)
- Yosemite (Released October 16, 2014)
- El Capitan (Released September 30, 2015)

NOTE: We are NO longer supporting Lion (Released July 20, 2011) as Oracle are no longer supporting it.

Extracting and Renaming
After extracting *securedv29PCEMacClient.mpkg.zip* you should have the following 2 folder instances on your machine;

__MACOSX

PCEMacClient.mpkg

Next, **<u>before</u>** deploying the V6 Mac OSx Client you must first correctly rename the folder instance *PCEMacClient.mpkg*

NOTE: You do not have to specify any Proxy details when renaming your package file. Ignore and leave out of the renaming process if you do not use Proxy, use transparent Proxy and/or your existing V6 Clients are communicating with your PCE Server and auto updating without issue. Proxy Port and Proxy IP/DNS values are usually specified in the default browser (LAN Settings).

<u>Central (shared/hosted) PCE Server Installations</u>
For this example the Policy Central Server URL is *myschool.fslhost.org*
The install location (school/academy/college etc.) is Grange Hill and this site's unique Client ID is *grangehill*.
The Proxy Port is *8080* and the Proxy ID is *myproxyserver.org*
Therefore the V6 Client Installer Package needs renaming as follows;

Proxy

From	PCEMacClient.mpkg
To	*PCEMacClient.myschool.fslhost.org@8080!myproxyserver.org#grangehill.mpkg*

No Proxy

From	PCEMacClient.mpkg
To	*PCEMacClient.myschool.fslhost.org#grangehill.mpkg*

Local PCE Server Installations (No Client ID required)
For this example the Policy Central Server computer name is *FutureDigital*
The Proxy Port is *8080* and the Proxy ID is *77.38.110.75*
Therefore the V6 Client Installer Package needs renaming as follows;

Proxy

From	*PCEMacClient.mpkg*
To	*PCEMacClient.FutureDigital@8080!77.38.110.75.mpkg*

No Proxy

From	*PCEMacClient.mpkg*
To	*PCEMacClient.FutureDigital.mpkg*

Installation
Finally to install the client, double-click the renamed *mpkg* folder instance or run via your MAC network deployment software.
